

Connexions

Connexions is a modular cage suite, suitable for security and demarcation within an office, co-location facility or other environment where restricted access is required. It is commonly used for managing, organising and protecting IT equipment and network cabling and provides a high security alternative to a cabinet.

Connexions unique design ensures quick and easy installation. It is constructed from a series of panels and posts which are combined together to create a secure area of almost any shape or size. Fully demountable, changes to your business requirements can be accommodated easily by repositioning, enlarging or reducing. This can be completed by your own staff or by one of our installation engineers.

Members of our team are also available to offer personal advice on the design and layout of your Connexions Suite, to maximise the available space.

Manufactured from 1.5mm thick steel, Connexions has standard heights of 2.4m, 2.7m and 3m.

Connexions is stylishly finished. A square pattern design and smooth black and grey finish, ensure it will fit well with most decor. Other hole patterns and colours are available by special order.

A roof can be added for additional security.

Panels are punched to leave approximately 53% free space allowing air to circulate freely.

A high security door is accessed with an authorised key, with standard widths of 900mm, 1200mm, 1800mm, or 2400mm. Access control options can also be incorporated which record when the lock is activated, by whom and for how long the door was open.

Connexions panels can be secured either 40mm off the ground to improve airflow and access to floor tiles, or floor fixed for added security.

As Connexions is a fully integrated system, inside additional space means cables can be accessed and managed easier. Double Panduit® and Ladder Bracing provide yet more storage space for cable management, making it easier when trouble shooting, to access equipment, therefore reducing downtime and money.

Sturdy 19" steel racks, able to hold up to 500kg each are secured to the connexions frame by Ladder Bracing, providing a much more stable structure than cabinets.

OPTIONS

19" 45U Racks

IT equipment and network cables are stored on 19" 45U two pillar racks with shelving installed at suitable heights. They are secured to Connexions via Ladder Bracing. Manufactured from steel, these racks are a robust and a cost effective alternative to cabinets. Each pair of 10" steel shelves are able to hold up to 100kg, making this system ideal for housing heavy equipment.

Ladder Bracing

The steel two pillar racks are tied to the Connexions frame by Ladder Bracing, providing a structure that is more stable than traditional cabinets, as well as providing overhead cable trays.

Cable Management

Connexions caging and racking is designed to work with a full range of Panduit cable management options. Much more cable management space can be provided with the Connexions system.®

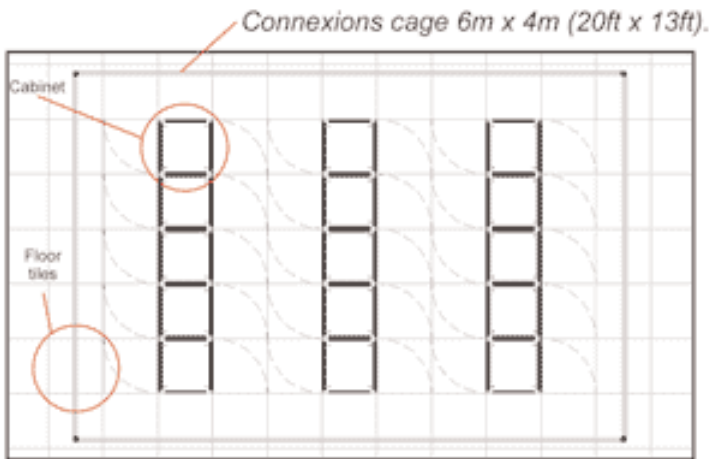

Under- Floor Barriers

Preventing unauthorised access to equipment by way of the floor tiles is made simple with Under-Floor Barriers. Made from steel, they are positioned in the floor cavity below the cage walling and secured to the concrete floor.

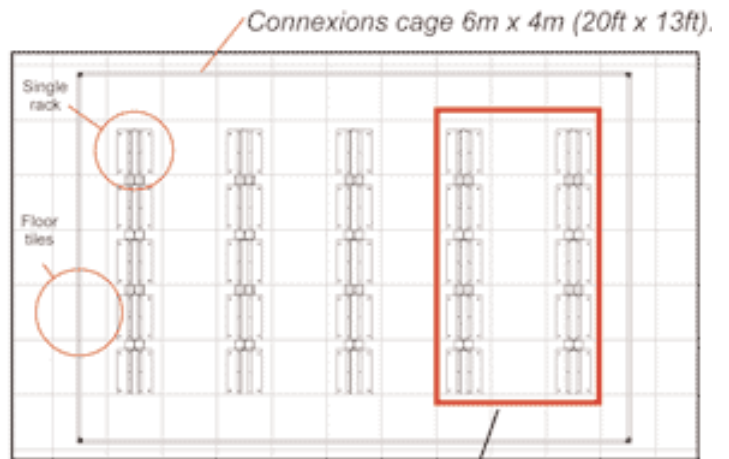

Space Efficiency - Racks V Cabinets

The racks are designed to stand within the traditional floor tile dimensions of 600mm x 600mm. In doing so, extra space is available for additional racks. In an area where 15 cabinets would be placed, 25 racks with the same capacity can be placed.

Cabinets

Racks

This much extra space is available when Cross-guard racks are used, providing space for additional racks.
